I am writing to apply for the Senior Corporate Infrastructure Engineer position at Wolt. Wolt's mission to build technology that brings joy and simplicity to neighborhoods around the world, combined with its scale across 500+ cities, makes this an exciting opportunity to contribute to infrastructure that powers real-world impact.

Through my professional experience, I have worked extensively with AWS, Docker, Kubernetes, and Linux-based systems. I have deployed and maintained applications on cloud infrastructure, managed CI/CD pipelines, and worked with monitoring tools including Prometheus and Grafana. My experience with microservices architectures and containerized deployments aligns well with the infrastructure needs of a large-scale delivery platform.

One area that particularly interests me is infrastructure automation and observability. I built a real-time server health monitoring dashboard using Node.js, Express, Socket.IO, and Docker that tracks availability, latency, and system metrics across multiple endpoints. This project involved designing a scalable architecture with live data streaming, role-based access control, and fully Dockerized production deployment. It reflects my ability to build and maintain the kind of automated, observable systems this role requires.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my infrastructure and systems experience can contribute to Wolt and DoorDash's IT operations.

Sincerely,

Md Shahanur Islam Shagor
