I am writing to apply for the SVP Operations role at Serverfarm. Your focus on scaling data center infrastructure through automation, technology enablement, and operational excellence is something I find genuinely compelling, especially as AI adoption and cloud migration continue to reshape the industry.

My engineering background centers on building reliable, observable systems. I have worked extensively with Docker, Kubernetes, Prometheus, and Grafana to deploy and monitor production environments. I also have experience with CI/CD pipelines, Linux server administration, and Nginx configuration, which gives me a practical understanding of the infrastructure layer that underpins large-scale operations.

One area where my experience directly connects to your needs is in real-time monitoring and incident response. I built a full-stack server health monitoring dashboard using Node.js, Socket.IO, and React that tracked availability, latency, and system metrics across multiple targets simultaneously. The system pushed live data to the browser, enabling immediate visibility into system status and supporting faster escalation and resolution. This kind of tooling is essential for maintaining uptime and service continuity in multi-site environments.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my background in automation, monitoring, and infrastructure technology could contribute to Serverfarm’s operational goals.

Sincerely,

Md Shahanur Islam Shagor
