I am writing to apply for the Middle Software Engineer position on the Geo Information Systems team at Flix. Flix's mission to make mobility smarter and more sustainable through technology-driven solutions is genuinely compelling, and I am particularly interested in working on backend services that process real-time vehicle and ride data at scale.

With over 4 years of professional software development experience, I have built and maintained web applications and HTTP APIs across multiple stacks. My backend work has involved designing RESTful APIs, optimizing database queries, implementing authentication and role-based access control, and deploying services on Linux servers using Docker and CI/CD pipelines. I am comfortable taking ownership of services throughout their lifecycle, from initial design to production monitoring and continuous improvement.

One area that aligns well with this role is my experience building real-time features and streaming data pipelines. I have developed systems using Socket.IO and WebSockets to push live updates to connected clients, and I have worked with event-driven architectures that require reliable data ingestion and processing. I also have hands-on experience with AWS, Kubernetes, and monitoring tools like Prometheus and Grafana, which I have used to maintain production-grade services.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my engineering background can contribute to Flix's Geo Information Systems team.

Thank you for your time and consideration.

Sincerely,

Md Shahanur Islam Shagor
