I am writing to apply for the Software Developer in Test II - Java position at Onapsis. The work Onapsis does in securing business-critical applications for global enterprises is genuinely important, and I find the intersection of cybersecurity, automation, and quality engineering particularly compelling.

Through my professional experience as a software engineer, I have built a strong foundation in programming with JavaScript, Python, and TypeScript, and I have applied these skills across full-stack development, API integration, and test automation. I am comfortable designing and executing test procedures, working with CI/CD pipelines, and ensuring software quality through automated testing frameworks.

One area that aligns well with this role is my experience testing REST and GraphQL APIs using Postman, as well as working with databases like MySQL and PostgreSQL. I have also developed and deployed applications in Linux environments, using Docker and Nginx for containerization and server management. My familiarity with CI/CD tooling and version control (Git) supports the kind of disciplined, quality-focused engineering culture Onapsis emphasizes.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my background in software engineering and test automation can contribute to Onapsis’s mission of protecting the world’s most critical business applications.

Sincerely,

Md Shahanur Islam Shagor
