I am writing to apply for the Senior Hardware Development Engineer position at Nordran Technologies. Your work on making liquid cooling chemistry measurable and controllable for AI infrastructure is a compelling challenge, and I am interested in contributing to the productization of your sensing platform.

Through research and development work, I have built and tested physical systems that combine embedded hardware, sensors, and real-time processing. One example is the Wireless Vision-Aid for the Blind (WVAB), where I integrated a YOLOv8n object detection pipeline with a Raspberry Pi and ESP32-CAM, using a custom UDP streaming protocol for low-latency communication. This required hands-on debugging across electronics, firmware, and system integration, as well as validation testing for real-world deployment conditions.

I also developed OmniGuard V2X, a privacy-preserving blockchain framework for autonomous vehicle networks, which involved working with NVIDIA Jetson Nano, ESP32, and Raspberry Pi for secure V2X communication. This project required me to think deeply about failure modes, tolerances, and real-world operating conditions, as well as to iterate quickly based on test results and field feedback.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I am eager to bring my hands-on hardware development skills and systematic approach to productization to Nordran. I have attached my CV for your review and look forward to the possibility of discussing how I can contribute to your team.

Sincerely,

Md Shahanur Islam Shagor
