I am writing to apply for the Head of R&D position at Nordran Technologies. Your approach to making liquid cooling chemistry measurable and controllable for hyperscale AI data centers addresses a critical gap in AI infrastructure reliability, and I find the challenge of taking a novel sensing platform to commercial-grade performance compelling.

Through my research and development work in autonomous systems and AI engineering, I have built intelligent systems that operate in complex real-world environments. This work has required a relentless focus on tightening tolerances, reducing noise, and identifying performance bottlenecks. I am comfortable thinking in terms of governing variables, failure modes, and uncertainty bounds, and I understand how to connect experimental rigor to real-world product requirements.

One area that particularly interests me is the systematic approach to stress, aging, and reliability testing. In my previous work on hardware-software integrated systems, I designed and executed rigorous testing protocols to ensure stability across varying conditions. I am experienced in identifying dominant performance limitations and translating experimental findings into concrete improvements that move systems toward production readiness.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how I can contribute to Nordran’s mission.

Sincerely,

Md Shahanur Islam Shagor
Full-Stack Developer & AI Engineer
