I am writing to apply for the Engineering Lead position at beatvest. Your work on digital investment and financial education platforms for banks and enterprises is directly relevant to my experience in building scalable, secure software systems for business environments.

My professional background is in full-stack development with a strong focus on PHP/Laravel and TypeScript/Next.js. Over the past four years, I have designed and delivered web applications that handle authentication, role-based access control, API integration, and real-time features. This technical foundation maps well to the stack and responsibilities described in your role.

In my previous work, I took technical ownership of projects from architecture discussions through to deployment. I have experience conducting code reviews, optimizing database performance, and collaborating with product and design teams to turn complex requirements into working solutions. I am comfortable discussing security, compliance, and integration trade-offs with both technical and non-technical stakeholders.

One area that particularly interests me is the hands-on nature of this role. I prefer working directly with implementation rather than staying at a purely architectural level. I have deployed applications on AWS with Docker, managed Linux servers with Nginx, and set up CI/CD pipelines. I also bring experience with API design and authentication mechanisms that are relevant to enterprise-grade fintech platforms.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how I can contribute to beatvest’s engineering team.

Thank you for your consideration.

Sincerely,

Md Shahanur Islam Shagor
