I am writing to apply for the Agentic AI for Science - Developer role at datin GmbH. Your mission to build autonomous AI agents that interact with knowledge graphs and unlock structured scientific data from physical R&D is exactly the kind of challenge I want to work on. The idea of designing production-grade agentic systems that empower scientists rather than replace them resonates with my own approach to building intelligent, practical tools.

My background combines software engineering with applied AI. I have over a year of experience building AI-driven systems, including agentic workflows that use LLMs for natural language understanding, tool calling, and automated data processing. I work primarily in Python and JavaScript, and I am comfortable designing modular, well-tested production code. I have integrated OpenAI APIs, built custom AI assistants, and deployed machine learning models in real-world applications.

One area that particularly interests me is building agentic architectures with tool-calling loops and memory layers. In a recent project, I developed an AI-powered financial platform where I designed a system that processes natural language requests, fetches data from external sources, generates PDF reports, and sends them automatically. This required orchestrating multiple API calls, managing state across workflows, and ensuring reliable execution. I also have experience training and fine-tuning models using frameworks like PyTorch, which I applied in a computer vision project using YOLOv8n for real-time object detection on edge devices.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review. I would welcome the opportunity to discuss how my experience building AI agents and production systems can contribute to datin’s vision of defining the grammar of scientific discovery.

Sincerely,

Md Shahanur Islam Shagor
