I am writing to apply for the Applied AI Engineer role at Bjak. The focus on building a proactive AI assistant that handles long-running workflows, persistent context, and real-world task completion aligns directly with the kind of engineering problems I enjoy solving.

Through research and development work, I have built and shipped AI features end-to-end, from model selection to production deployment. I have worked with Python, OpenAI-style APIs, and vector databases to create intelligent systems that go beyond simple demos. One area I have focused on is turning raw model outputs into structured, reliable behaviors, designing prompts, tools, and agent workflows that perform consistently under real-world conditions.

A relevant example is an AI-powered financial application I developed. The system uses OpenAI assistants trained on custom datasets, processes voice inputs through AWS Transcribe, and generates PDF term sheets automatically. I handled the full pipeline: API development with Express and TypeScript, integration with AWS services, and deployment on EC2 with Nginx. This required debugging across model behavior, orchestration, infrastructure, and user experience layers, exactly the kind of end-to-end ownership this role demands.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my background in applied AI and systems engineering can contribute to Bjak’s mission.

Sincerely,

Md Shahanur Islam Shagor
