I am writing to apply for the Senior Backend Engineer - Accounts role at SumUp. Your mission to build a unified global banking infrastructure for small merchants is exactly the kind of large-scale, high-impact engineering challenge I want to contribute to.

My backend engineering experience spans Go, PostgreSQL, AWS, Docker, and Kubernetesâ technologies that directly overlap with your stack. I have designed and built RESTful APIs, modeled relational databases for consistency and performance, and deployed cloud-native applications on Linux servers with Nginx and CI/CD pipelines. I am comfortable working with distributed systems and understand the importance of decoupled, observable architectures.

One area that particularly interests me is event-driven design. In a recent project, I built a real-time server monitoring dashboard using Node.js, Express, Socket.IO, and Docker. The system streamed live metrics from multiple target URLs to connected clients, handling concurrent data streams with low latency. This experience gave me practical exposure to building resilient, event-driven systems that push data in real timeâ similar to the Kafka-based architecture your team relies on.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my backend engineering background can support SumUp’s Global Accounts platform.

Sincerely,

Md Shahanur Islam Shagor
