I am writing to apply for the Staff Software Engineer Infrastructure role at Docker. Docker's mission to provide secure, sandboxed environments for developers and its position at the center of the shift toward AI-assisted workflows is exactly the kind of infrastructure challenge I want to work on.

My technical background is rooted in Go, Docker, Kubernetes, and Linux-based systems. I have built and deployed production applications using Docker containers, managed multi-service architectures with Nginx and CI/CD pipelines, and worked extensively with cloud platforms including AWS and Google Cloud. I also have hands-on experience with Prometheus and Grafana for observability, which directly maps to the SLO and alerting improvements this role requires.

A relevant example is a real-time server health monitoring system I built using Node.js, Socket.IO, and Docker. The system tracked availability and latency of multiple endpoints, streamed live metrics to the frontend, and was fully containerized for deployment. This project required designing a scalable architecture, implementing role-based access control, and ensuring reliable real-time data delivery, all of which are skills I would bring to building self-service platform APIs and improving operational workflows at Docker.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my background in infrastructure, Go, and platform engineering can contribute to Docker's internal platform goals.

Sincerely,

Md Shahanur Islam Shagor
