I am writing to apply for the Embedded Software Developer Automotive Radar position at smartmicro. Your work on high-performance radar sensors for autonomous driving and intelligent traffic infrastructure is directly relevant to my interests in building reliable, real-world systems that combine software, hardware, and autonomy.

Through research and development work, I have built practical experience with C++, Python, and Linux-based systems. One project that closely aligns with your embedded development focus is the Wireless Vision-Aid for the Blind (WVAB), a real-time assistive system I architected using YOLOv8n, Python, C++, Raspberry Pi, and ESP32-CAM. This involved designing ultra-low latency UDP streaming, performing local inference on edge hardware, and integrating multiple software modules into a cohesive, offline-capable system. The project required careful interface design between the camera module and processing unit, similar to the software module integration and interface adaptation described in your role.

In addition to C++ and Python, I have used PyTest for unit and integration testing in my development workflow. I am comfortable working with Git for version control and have experience deploying and maintaining applications on Linux servers. My background also includes working with Docker and Nginx, which supports the embedded Linux environment common in radar development.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how my skills can contribute to smartmicro’s radar sensor development.

Sincerely,

Md Shahanur Islam Shagor
