I am writing to apply for the Senior Data Engineer (w/m/d) role at Skalar. The opportunity to build a greenfield data warehouse and shape the data foundation for an AI-first company in the tax and accounting space is exactly the kind of challenge I want to take on.

What stands out to me about Skalar is the focus on using AI to transform a traditionally painful process into something radically simple. I have practical experience integrating AI into production systems, including training AI assistants with OpenAI's latest models and using APIs like Replicate for image processing. I also built systems that handle real-time data, third-party API integrations, and asynchronous workflows, which directly relates to building resilient ETL/ELT pipelines from messy financial data sources.

Through hands-on project development, I have worked extensively with TypeScript, Next.js, and PostgreSQL, which matches your current product stack. I have designed and built full-stack applications that required complex data handling, role-based access control, secure authentication, and real-time features. I am comfortable working with cloud infrastructure, having deployed applications on AWS and managed Linux servers with Docker and Nginx.

In addition to my technical experience, I work effectively across multidisciplinary teams and communicate clearly with both technical and non-technical stakeholders. I am fluent in Bengali and English, have working knowledge of Russian and Hindi, and enjoy collaborating in international and cross-cultural environments.

I have attached my CV for your review and would welcome the opportunity to discuss how I can contribute to building Skalar's data infrastructure from the ground up.

Sincerely,

Md Shahanur Islam Shagor
Full-Stack Developer & AI Engineer
